Need countData and colData to match up, so we need to get rid of the odd first column in countData (the length column)

Q. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

Q. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

Section 2. Pathway Analysis

The main gage() function requires a named vector of fold changes, where the names of the values are the Entrez gene IDs.

Note that we used the mapIDs() function above to obtain Entrez gene IDs (stored in res\$entrez) and we have the fold change results from DESeq2 analysis (stored in

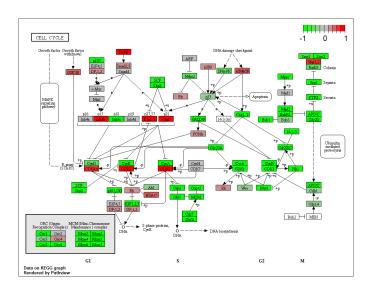

```
res$log2FoldChange).

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Endosomal/Vacuolar pathway has the most significant entities pvalue. The most significant pathways have seem to have a lot to do with the cell cycle/replication, which matches some of the downregulated KEGG results, but not the upregulated results. Differences in how the genes were categorized could cause differences between the two methods.
